

Power Lift - Two Workers

Ensure safe body mechanics throughout the move.

Position yourself as close to the object as possible.

Grasp the object with a safe effective grip.

In unison, prepare for moving the object.

In unison, move the object to the second location. Take effective steps - do not plant your feet and twist your body. Keep the object close to your body.

In unison, prepare for placing the object at the second location.

To complete the moving technique, the workers ensure the object is safely positioned with any labeling clearly visible.

Following completion of the move, **evaluate**:

- Did the workers feel that the move compromised their own safe body mechanics?
- At any time did the workers feel the load was too heavy, awkward?
- Was the load somewhat unstable during the move?

If the response to any question is yes, consider re-assessing the selected technique and ensuring appropriate documentation and communication are completed.

Refer to the program's User Manual[®] for additional details.
